

Opportunity Title: Isotopic Characterization of Presolar Grains to Discern their Origins and Histories

Opportunity Reference Code: 0016-NPP-NOV26-JSC-PlanetSci

Organization National Aeronautics and Space Administration (NASA)

Reference Code 0016-NPP-NOV26-JSC-PlanetSci

How to Apply All applications must be submitted in [Zintellect](#)

Please visit the NASA Postdoctoral Program website for application instructions and requirements: [How to Apply | NASA Postdoctoral Program \(orau.org\)](#).

A complete application to the NASA Postdoctoral Program includes:

1. Research proposal
2. Three letters of recommendation
3. Official doctoral transcript documents

Application Deadline 11/1/2026 6:00:59 PM Eastern Time Zone

Description About the [NASA Postdoctoral Program](#)

The [NASA Postdoctoral Program \(NPP\)](#) offers unique research opportunities to highly-talented scientists to engage in ongoing NASA research projects at a NASA Center, NASA Headquarters, or at a NASA-affiliated research institute. These one- to three-year fellowships are competitive and are designed to advance NASA's missions in space science, Earth science, aeronautics, space operations, exploration systems, and astrobiology.

Description:

Presolar grains are bona fide pieces of stardust that condensed in the outflows of evolved stars, supernovae, and novae, and retain the highly anomalous isotopic compositions of their parent stars. As such, the isotopic characterization of presolar grains in the laboratory provides remarkable insight into stellar and galactic chemical evolution, and nucleosynthetic and mixing processes. Moreover, their mineralogies allow us to understand dust condensation processes in stellar atmospheres. Presolar silicate grains are particularly susceptible to alteration and their mineralogies and abundances in meteorites and interplanetary dust particles allow us to assess the degree of secondary hydrothermal alteration on the parent body and in interstellar space. As these grains constitute a building block of the Solar System, understanding their origins and histories is intimately linked with understanding the origin of the Solar System.

Research will focus on the multi-element isotopic analysis of presolar grains found in primitive meteorites and interplanetary dust particles using the NanoSIMS 50L instrument in the Astromaterials Research and Exploration Science (ARES) division at JSC. Data will be interpreted in the context of astrophysical models. We specialize in coordinating NanoSIMS analyses with focused ion beam (FIB)-assisted transmission electron microscope (TEM) mineral analyses of presolar grains, and these studies are highly encouraged. Other advance instrumentation available within

Whether you are just starting your career or already at a senior level, ORAU offers internships, fellowships, research opportunities, and contract positions that can provide you with invaluable experience. Download the ORAU Pathfinder mobile app and find the right opportunity to propel you along your career path!

Opportunity Title: Isotopic Characterization of Presolar Grains to Discern their
Origins and Histories

Opportunity Reference Code: 0016-NPP-NOV26-JSC-PlanetSci

ARES include scanning electron microscopes, electron microprobe, Raman
microprobe, X-ray computed tomography (CT) scanner, and an array of
spectrometers.

Location:
Johnson Space Center
Houston, Texas

Field of Science: Planetary Science

Advisors:
Ann Nguyen
lan-anh.n.nguyen@nasa.gov
(281) 483-9446

Eligibility is currently open to:

- U.S. Citizens;
- U.S. Lawful Permanent Residents (LPR);
- Foreign Nationals eligible for an Exchange Visitor J-1 visa status; and,
- Applicants for LPR, asylees, or refugees in the U.S. at the time of application with 1) a valid EAD card and 2) I-485 or I-589 forms in pending status
